

3115. Diana Bell. Algaestrips.

Algaestrips are a unique formulation of methylcobalamin (vitamin B-12) supplement designed specifically to meet the needs of those who require vitamin B-12 supplementation, such as those on plant based diets exclusively, those with gastric surgery, those with pernicious anemia, as well as those with other medical conditions. Algae provides an all natural basis to a delivery system which is pleasant to the taste, dissolves readily, and is rapidly absorbed, and thus is an ideal delivery system for the majority of patients. Methylcobalamin, unlike the cheaper more common cyanocobalamin, provides for a entirely natural source of vitamin B12 and avoids the possible toxicity of the attached cyanide. Furthermore, methylcobalamin may help to remove unneeded cyanide from the body.

A plant based diet is the most environmentally low impact way to eat and algae is a plant and thus is completely sustainable, this is a superior solution for providing B-12. The algae which is used in algaestrips are derived from *Lessonia Trabeculata*.
